

If you try to run the program, please use the following format:
\$ python proj1.py N K E

For example, if you wanna test $N = 1$, $K = 2$ with effort of 500000, please just type in:
\$python 1 2 500000

then the program will generate the panel automatically and jump the fitness value.

Now I am using the picture "mon_child.jpg" as the test case. If you wanna test other examples, please

edit the imHeight, mWidth and the img in the program directly.
